

Milestone towards a nuclear-free world

Promising United Nations Decade of Sustainable Energy for All ► [2015 Action plan](#)

Successful Negotiations for the Reduction of Uranium Enrichment in Switzerland

Consensus on Reducing Nuclear Enrichment

In historic negotiations between Iran and the nuclear powers it was agreed that Iran will drastically reduce the enrichment of Uranium and not pursue plans to make nuclear bombs.

This is a first step towards implementing the appeal to the United Nations to prohibit all Uranium enrichment by all nations and to stop all nuclear power to halt further radioactive pollution as demanded by international radiation experts and the World Health Organization and UNEP- see www.radiation.org & www.who.org & www-unep.org and following appeal to the UN.

Appeal to the Secretary General and all United Nations Bodies, Academia, Heads of State and Energy, Health and Environment Organizations

STOP the Nuclear Madness

The most criminal invention is the enrichment of Uranium and the most absurd term is “peaceful use of nuclear energy” as abused by many promoters of this fatally destructive, lethal technology. Enriched Uranium, radioactive emissions and the waste from nuclear power plants could sooner or later eliminate all life on Earth as observed at Chernobyl, causing the deadly radioactive cloud over Europe and the radioactive leaks into the Pacific Ocean from Fukushima killing sea life, making fish lethal and all Pacific coasts radioactive for thousands of years.

Besides such inevitable risks nuclear power is the most expensive method to generate electricity with the scarce finite resources Uranium or Thorium.

Sustainable Clean Energy Advancement

Total world solar energy capacity passed 200 GW

Total world wind power capacity passed 400 GW

Total world hydropower capacity passed 1000 GW

Nuclear power down to less than 290 GW

This finite unsustainable lethal technology will play a marginal role in future energy production.

Statistics show undeniably that populations near natural Uranium deposits and around all nuclear power plants suffer from invisible Strontium-90, Cesium, Cobalt and Tritium contaminations causing cancer, loss of teeth, childbirth complications and premature death. See www.radiation.org and dire warnings on www.uniseo.org. Nuclear technologies are neither peaceful nor safe because of human failures (Chernobyl, Sellafield, Three-Miles Island and Fukushima etc.). Natural disasters (Fukushima), material fatigue in hundreds of cases, possible meteorite hits or rockets from terrorists or wars are unpredictable and unavoidable. The radioactive waste cannot be safely deposited. Nuclear power is not clean at all, as stressed by its proponents, nor CO₂ neutral with all the uranium mining, enrichment and transportation needing fossil fuels !

For the cost of a nuclear power plant several wind farms, solar systems, geothermal or hydropower plants can be built with a multiple of the power and at no fuel cost. The life cycle of a nuclear power plant is a catastrophe with fatal radioactive emissions over and beyond its whole operation, leaving deadly traces to future generations, all life on Earth and its biospheres.

No nation has the right to endanger whole populations beyond its borders affecting future generations forever with **cancer**, infertility and endangering life on Earth and in the seas !

Therefore all nuclear power must be stopped as fast as possible
by a United Nations resolution and by all governments to allow the survival on Earth !

 Too many signs that the Pacific Coasts are being deadly threatened by Nuclear Radiation from Fukushima

 Every single day 300 tons of radioactive water from Fukushima entered the Pacific Ocean. That means that the total amount of radioactive material released was constantly increasing, and it is steadily building up in our food chain. Ultimately, all of this nuclear radiation will outlive all of us. It will take decades to clean up the Fukushima disaster, and meanwhile countless innocent people will develop **CANCER** and other health problems as a result of exposure to high levels of nuclear radiation. Such nuclear disasters, as experienced also in Chernobyl and with all Strontium and other lethal leakages will wipe out all life on Earth, if the United Nations Organisation is not enforcing international laws to stop all nuclear power plant projects and to decommission all existing ones !

There is too much evidence that the life of the whole world is being endangered by nuclear radiation ! 

Polar bears, seals and walrus along the Alaska coastline are suffering from fur loss and open sores. 

Wildlife experts are studying whether fur loss and open sores detected in polar bears in recent weeks is widespread and related to similar incidents among seals and walrus. The bears were among 33 spotted near Barrow, Alaska, during routine survey work along the Arctic coastline. Tests showed they had alopecia, or loss of fur and other skin lesions, the U.S. Geological Survey said in a statement. 

 There is an epidemic of sea lion deaths along the California coastline  At island rookeries off the Southern California coast, 45 percent of the pups born in June have died, said Sharon Melin, a wildlife biologist for the National Marine Fisheries Service based in Seattle. Normally, less than one-third of the pups would die. It has gotten so bad that the National Oceanic and Atmospheric Administration declared an unusual mortality event

 Along the Pacific coast of Canada and the Alaska coastline, the population of sockeye salmon is at a historic low. 

 Something is causing fish all along the West coast of Canada to bleed from their gills, bellies and eyeballs 

 A vast field of radioactive debris from Fukushima the size of California has crossed the Pacific Ocean 

 The radioactivity of coastal waters off the U.S. West coast could double over the next five to six years 

 Experts have found very high levels of Cesium-137 in plankton living in the waters of the Pacific Ocean 

 One test in California found that 15 out of 15 bluefin tuna were contaminated with radiation from Fukushima 

 Fish samples tested to date have had very high levels of radiation: up to 1,000 Becquerels per kg of Cesium 

 Some experts believe that we could see very high levels of **CANCER** from people eating contaminated fish !! 

 A study concluded that Fukushima released up to 210 quadrillion Becquerels of Cesium-137 into the air !
